

1 EMBARGOED DRAFT-NOT FOR REDISTRIBUTION
 2 PUBLIC HEALTH

3 4 Building Microbial Forensics as a 5 6 7 Response to Bioterrorism 8

9 Bruce Budowle,^{1*} Steven E. Schutzer,² Anja Einseln,¹ Lynda C. Kelley,³ Anne C. Walsh,⁴
 10 Jenifer A. L. Smith,¹ Babetta L. Marrone,⁵ James Robertson,¹ Joseph Campos⁶

13 Bioterrorists use microbes or their toxins
 14 to invoke fear, to inflict harm, and to im-
 15 pact economic well-being (1, 2). Although
 16 microbes have been used as weapons for
 17 centuries (3, 4), the anthrax letter attacks
 18 of 2001 generated great terror in the pub-
 19 lic. The attacks and subsequent public re-
 20 actions revealed the need for an infrastruc-
 21 ture with analytical tools and knowledge
 22 bases to rapidly provide investigative leads
 23 and help determine who was responsible
 24 for the crime (i.e., attribution), the source
 25 of the anthrax, and how and where the
 26 weapon was produced (Fig. 1).

27 There are examples of well-developed
 28 practices for handling and analyzing
 29 pathogenic agents (5, 6). However, many
 30 of these assays address epidemiological
 31 concerns and do not provide sufficient in-
 32 formation on the strain or isolate to allow
 33 law enforcement to better identify the
 34 source of the evidence sample. The con-
 35 tinued development of additional assays
 36 for individualization of microbial strains is
 37 needed. For example, determining the mi-
 38 crobe sent in a letter as *Bacillus anthracis*
 39 identifies the causative agent. At this point
 40 anyone who had access to *B. anthracis* is
 41 considered a potential perpetrator of the
 42 crime. But determining it was the Ames
 43 strain, an uncommon strain in nature, lim-
 44 its the investigation to those who had ac-
 45 cess to the specific strain and exculpates
 46 innocent scientists investigating *B. an-*
 47 *thraxis*. All of the above must be defined
 48 adequately and validated sufficiently to
 49 meet forensic needs. Furthermore, there
 50 are not many laboratories with adequate
 51 biocontainment facilities to handle forensic

cases. Partner laboratories with specialty
 expertise will assist in investigations (see
 below). There is little guidance on the lo-
 gistics and financial commitment required
 to construct a microbial forensics labora-
 tory or to retool partner laboratories to per-
 form microbial forensic work.

The U.S. government now has the goal
 of instituting a dedicated national micro-
 bial forensics system. Microbial forensics

can be defined as a scientific discipline
 dedicated to analyzing evidence from a
 bioterrorism act, biocrime, or inadvertent
 microorganism/toxin release for attribution
 purposes. Law enforcement has had the
 traditional role and infrastructure for in-
 vestigating crimes and is now enhancing
 its capabilities to confront the new chal-
 lenge of biological weapon usage and bio-
 terrorism through partnership with the sci-
 entific community. To lay a proper
 foundation for the field of microbial foren-
 sics, the Federal Bureau of Investigation
 (FBI) initiated the Scientific Working
 Group on Microbial Genetics and Foren-
 sics (SWGMPG) on 29 July 2002 (7). This
 working group provides an avenue for sci-
 entists from diverse disciplines within the
 government, academia, and the private
 sector to address issues collaboratively and
 to develop guidelines related to the opera-
 tion of microbial forensics.

The FBI has hosted scientific working
 groups for other forensic disciplines. Per-
 haps the most notable is the Scientific
 Working Group on DNA Analysis Meth-
 ods (8). Its success can be seen by the

common use of DNA analysis in crime
 laboratories, the existence of standards of
 performance and practices, and the over-
 whelming acceptance of DNA analysis in
 the courts. Similarly, the SWGMGF aims
 to contribute to the infrastructure and de-
 velopment of tools for microbial forensics.

The members of SWGMGF, whose ex-
 pertise spans multiple diverse scientific
 disciplines, represent a number of govern-
 ment agencies (9) and academia (10). Sub-
 stantial input can also come from industry,
 and representatives from the private sector
 will be invited on a case-by-case basis for
 consultation. The cost of operations of the
 working group is relatively inexpensive
 because participants serve voluntarily.

The SWGMGF initially has focused on
 (i) defining quality assurance (QA) guide-
 lines for laboratories performing microbial
 forensic casework analyses; (ii) establish-
 ing criteria for development and validation

of methods to characterize or individualize
 various threat agents in ways that can be
 used forensically to attribute criminal acts;
 (iii) prioritizing efforts on those pathogens
 and toxins that would most likely be used
 in biocrimes; (iv) understanding and en-
 hancing microbial population genetic data
 so that a finding can be interpreted; and (v)
 establishing design criteria for information
 databases.

Because quality practices are so impor-
 tant for establishing a solid foundation and
 maintaining credibility, the top priority
 was to develop a QA document for labora-
 tories performing microbial forensic analy-
 ses. The QA guidelines document has been
 completed and is presented here (see *Sci-*
ence Online). We address the whole labo-
 ratory infrastructure and processes encom-
 passing the analytical typing process
 including organization, management, per-
 sonnel education and training, facilities,
 security, documentation, data analysis,
 quality control of reagents and equipment,
 technical controls, validation, proficiency
 testing, reporting of results, auditing of the
 laboratory procedures, and safety.

1 These QA guidelines are based on the
2 standards for human forensic DNA typing
3 (11), clinical laboratories standards (12),
4 and the International Standards Organiza-
5 tion (13), as well as the experience of a
6 broad range of scientists. Earlier drafts of
7 this QA guidelines document were pre-
8 sented for commentary to members of sev-
9 eral universities, public health depart-
10 ments, hospitals, and professional societies
11 to obtain broad input from the scientific
12 community. The QA guidelines must be
13 continuously reviewed so that they can
14 evolve on the basis of experiences and cur-
15 rent challenges. Comments for improving
16 these guidelines are necessary and wel-
17 comed and should be sent to the authors.
18 We also welcome input that may facilitate
19 implementation.

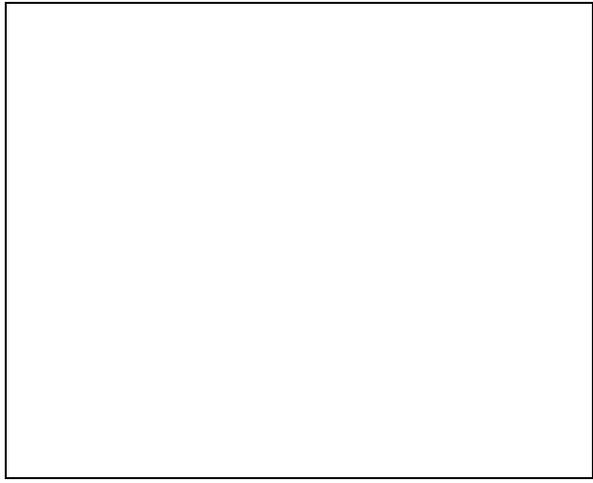

20 We believe these guide-
21 lines will provide a basis for
22 uniform quality practices for
23 laboratories performing mi-
24 crobial forensics work, as
25 well as others in various
26 fields of science. Microbial
27 forensics draws on the exper-
28 tise of many disciplines. For
29 example, an investigation
30 may require a microbiologist
31 for evaluating culture mor-
32 phology, a chemist for isotope
33 analysis, a molecular biolo-
34 gist for genetic typing, and a
35 forensic scientist for finger-
36 print analysis. Each of these
37 scientists will need to carry
38 out analyses under quality
39 practice conditions appropri-
40 ate to a forensic investigation.

41 Documents such as the QA guidelines pro-
42 vide focus and guidance for scientists who
43 perform analytical work. Moreover, these
44 guidelines can serve as a template for mi-
45 crobiology, molecular biology, and other
46 application-oriented laboratories. In addi-
47 tion, our efforts may stimulate develop-
48 ment of new approaches and technologies.

49 The recommendations of the
50 SWGMGF will be implemented in the na-
51 tional microbial forensics laboratory net-
52 work, other partner laboratories, and,
53 where applicable, subcontracted laborato-
54 ries. The United States is developing the
55 National Bioforensics Analysis Center
56 (BFAC), which is part of the National
57 Biodefense Analysis and Countermeasures
58 Center (NBACC) and the Fort Detrick
59 (Frederick, MD), interagency biodefense
60 campus (14). The BFAC and partner labo-
61 ratory network will serve as the national
62 forensic reference center to support home-
63 land security for the attribution of the use
64 of biological weapons. The laboratory will
65

be supported primarily by the Department
of Homeland Security (DHS) in partner-
ship with the FBI, and the BFAC will exe-
cute and coordinate microbial forensic
casework.

To be successful, this national micro-
bial forensic laboratory must rely on at
least three major components. The first is a
knowledge center composed of databases
on genomics, microbiology, forensics
methods, associated materials, and related
evidence assays (including traditional fo-
rensic analyses such as fingerprints), bioin-
formatics, and standardized tools. The sec-
ond component is the maintenance of
strong partnerships between existing gov-
ernment, academic, and private-sector as-
sets. These will include Plum Island, De-
partment of Defense, Department of

Energy, Department of Health and Human
Services, National Science Foundation,
National Laboratories, specialty technol-
ogy laboratories, and other centers of ex-
cellence. No single laboratory or institu-
tion can address all microbial forensic
needs. Although the FBI has at times
reached outside its own laboratory for sci-
entists to provide assistance in casework,
analysis of materials from the anthrax let-
ter attacks may be the first time that so
many outside scientists with diverse exper-
tise were employed. This may well be
standard practice in future cases. The third
component is the SWGMGF. The
SWGMGF's first contribution to the
BFAC and bioforensic network is these
QA guidelines. All of these components
will form a partnership network with the
capability of efficiently investigating po-
tential bioterrorist activity (Fig. 2).

In conclusion, scientists can play a sub-
stantial role in thwarting the use of
bioweapons by developing tools to detect

and to determine the source of the patho-
gen and to identify those who use such
biological agents to create terror or to
commit crime. By developing a robust mi-
crobial forensics field, security can be en-
hanced beyond physical locks and barriers.

Fig. 1. Techniques that can be used to analyze evidence and its components.

Fig. 2. Partnership network. Microbial evidence, either from real events or from hoaxes, may enter the bioforensic laboratory network by different routes. If an event is immediately recognized as an act of bioterrorism, any evidence will be sent directly by first responders, the intelligence community (IC), or the Department

1 of Defense (DoD) to the national bioforensic
2 laboratory. Alternatively, an event may be
3 thought to be naturally occurring and therefore
4 evidence will be sent to the public health sector,
5 i.e., the Laboratory Response Network (LRN)
6 of the Centers for Disease Control and Preven-
7 tion (CDC). Once the evidence is deemed to be
8 from an act of bioterrorism, the materials will
9 be sent by the LRN to the national bioforensic
10 laboratory for attribution analysis. That labora-
11 tory will carry out a suite of applicable assays,
12 as well as use the partnership network to en-
13 hance attribution characterization capabilities.
